A) Perceptron update : Weights only change if errors.

B) Linear separability : ~~If~~ A dataset that can be devided by a straight line.

C) Why XOR fails ? Cannot separate it using ~~linear~~ a straight line.

D) Perceptron vs delta rule : by threshold #

ANN / MLP

A) Role of non-linearly : Allow ~~on~~ networks to learn a non-linear path, allow networks to learn complex patterns.

B) Forward pass : Step-by-step computation to produce final prediction and loss.

C) Chain rule / backprop : Gradient descent update from output to input.

D) Learning rate : high η causes divergence, too low causes slow convergence.

. Capacity : The higher the more complex the model

. Regularization : L1, L2 / Dropout : Prevent overfitting and generalization, reduce model ~~Sensitivity~~ sensitivity.
