

Baseline W01 - W04 :

① ML Definition : Computers learn pattern from data to make predictions without ~~explicit~~ coding explicitly.

② Under/Overfitting :

- Underfitting means the model ~~learn~~ is too simple to ~~recg~~ recognize the patterns.

- Overfitting means the model memories everything in the data including noises or outliers ~~&~~ therefore it's bad to generalize and test data.

③ Bias-Variance TradeOff : Bias is error from oversimplify assumptions, Variance is the sensitivity to changes.

④ Entropy : measures data ~~in~~ uncertainty.

Info gain : measures the reduction of entropy after splitting.

⑤ Continuous / Missing ~~Attr~~ Attribute :

↳ meanⁿ

↳ Most common value.

⑥ Pruning : Reduce tree complexity, prevent overfitting.
